

## Free Webinar: Aging and Parkinson's Disease in Agriculture

Tuesday, April 13, 2021  
12:00PM - 1:00PM CST

**Summary:** Parkinson's disease impacts over one million people living in the United States. People living in rural areas may not have easy access to movement disorder specialists. Limited access to resources makes this diagnosis more challenging. Rural healthcare providers and agricultural professionals can develop an awareness of this neurodegenerative disorder and understand the effects on agricultural work. Participants will learn about rural specific resources, safety screening for aspects of agricultural work, tips to maximize farmer functioning, and communication strategies with farm families.

**Objectives: At the end of this presentation, learners will be able to...**

- Understand the impact of aging on the farming workforce
- Translate relevant strategies when interacting with people living with Parkinson's that work in agricultural production
- Understand why an in-home engagement is an important approach to consider for rural individuals with Parkinson disease
- Use evidenced-based screening tools to address safety and foster communication for individuals with movement disorders working in agriculture

**Intended Audience:** This course is intended for healthcare professionals, agricultural and agribusiness professionals, people engaged in agricultural work and families that encounter aging individuals living with movement disorders like Parkinson's. Anyone working with aging producers in rural America and interested in preserving their safety and function will find value in this educational offering.
